

Tunisia, audited — the engineer’s ledger

the energy balance, water chemistry, acid-stream assays, lift floors, and every gate
— everything a technical team verifies before FID.

Provenance law: MEASURED = cited anchor · DERIVED = arithmetic on measured values · ASSUMED = declared default. commercially-validated = 0 — no buyer has signed anything; published as zero on purpose. Generated 2026-09-09 by nations_audit.py / make_nations_pdfs.py — the same code that renders the page.

1. The energy ledger, leg by leg

Recovery ledger recomputed: 33.9 GWh/yr recovered + 20 GWh/yr dispatch value. The printed 82 GWh did not sum from its own legs (7.2 + 30 + 20 = 57.2; 24.8 unexplained) — corrected, with the arithmetic, on the page.

LEG	FORMULA	VALUE
Pump-as-turbines	$9.81 \times (70\% \times 150,000/86,400) \text{ m}^3/\text{s} \times 50 \text{ m} \times 75\% \times 8,760 \text{ h}$	3.9 GWh/yr
Heat recovery	$0.6 \text{ GJ/t} \times 2 \text{ Mt PG} \rightarrow 333 \text{ GWh thermal} \times 9\%$	30 GWh/yr
Flexibility	desal + storage follow the solar curve	20 GWh/yr (dispatch, not joules)
ERD	inside the 4 kWh/m ³ SWRO benchmark (~35-40% of RO energy)	0 added — no double count

2. Water — the numbers an EPC checks first

PARAMETER	VALUE	ANCHOR
SWRO specific energy	4 kWh/m ³ (benchmark incl. ERD)	Rw3 (mega-plant class)
Lift physics floor	1.09 kWh/m ³ per 400 m at 100% eff; 1.45 at 75%	Rw4 — the physics that decides where water may travel
Delivered inland cost	\$1.10-1.50/m ³ vs irrigation tariffs \$0.04-0.07	Rw6/Rw7 — inland water runs on brackish, not long-haul
SWRO CAPEX	\$800-1,200 per m ³ /day (mega-plant)	Rw2
Gate	blended $\geq \$0.68/\text{m}^3$, $\geq 60\%$ pre-sold, brine permit	computed (DSCR)

3. Materials — the acid stream

PARAMETER	VALUE	ANCHOR
REE content, Gafsa rock	322 mg/kg avg, peaks >1,700	Rm1

PARAMETER	VALUE	ANCHOR
PG partition of REE	60-85%	Rm2
Acid-stream U	85-90% of rock-U partitions to the wet-process acid	Ru1 (Freeport precedent)
U recovery (proven)	>95% DEHPA/TOPO, 14M lbs over 1978-99	Ru1
Radiology	Ra-226 214-970 Bq/kg in PG; exemption threshold 1,000 Bq/kg	Rm11/Rm12
Phase 0 assays	12 stream points: U, REE, Ra-226, Po-210, full metals	itemized in the audit

4. The dependencies, by status

DEPENDENCY	STATUS
Desal brine permit	in design — Gabes outfall / diffuser; permit required before SWRO FID
PG chemistry (Ra-226 partitioning)	Phase 0 assay — flowsheet keeps radium in gypsum (Freeport precedent); re-verify on Gafsa stream
Uranium handling	gate — CNSTN licensing, NORM transport, export controls
REE separation capex	later phase — +\$244M solvent-extraction plant beyond the ~\$100M circuit
Solar bankability	gate — DSCR ~0.9-1.0 at the record-low tariff; bankable region or grant support required
Grid connection	later phase — 3 GW connection + 400 kV upgrades ~\$450M
Compute accelerators	gate — export-control licenses; colocation until an anchor tenant is licensed
Truffle yield	gate — 376 kg/ha is the 20-yr Murcia average; gate = 3-season record >=200 kg/ha
Export prices	exposure — U spot \$80-95/lb; truffle EUR20-40/kg — no contracted offtake yet
Financing	uncommitted — DFI channel modeled for solar/desal; nothing committed

What this document is: a concept-level engineering design whose numbers are computed in code from sourced primitives — recomputed, corrected, and applied into the design. Free and public.

What it is not: a commissioned state program, a bank-grade feasibility study, an investment offer, or a claim that any of this has been built. Nothing here is advice to any government or any investor. Nothing replaces geological, radiological, geotechnical or EPC-level surveys. Verify every figure and citation before relying on any of it.
