High-Yield Biomanufactured Magnetosomes (FIONs) for Ultra-High Relaxivity MRI

REJECTED

This concept did **not** clear the framework.

The reasoning is published in full below.

What the assessment found

Incumbent benchmark

Feridex / Resovist / Gadolinium Chelates

Measured advantager2 relaxivity of 324-471 mM⁻¹ s⁻¹ vs 133 mM⁻¹ s⁻¹ for Feridex**Time to first revenue**

84 months

Regulatory risk

High — regulatory qualification is a material barrier (\$35,000,000 estimated)

Why it failed

- Voided by: Illegitimate incumbent, Capital and time to revenue

Assessment

This venture fails sub-test A by anchoring performance and margins to Feridex, a discontinued/withdrawn contrast agent. It also fails sub-test C because human clinical MRI contrast agents require extensive IND approvals and clinical trials, exceeding \$5M in pre-revenue CapEx and taking several years before first revenue.

Also flagged

- Comparator may have left the market
- Evidence rests on non-peer-reviewed sources
- Duplicate references inflating the evidence base
- no_production_runsheet

A rejection is not a claim that the science is wrong. It means the venture case did not survive: the comparator was not what the buyer actually buys, the comparison was not like-for-like, the advantage fell short of a step change, or the capital and time to first revenue were prohibitive.

Assessed 2026-08-28 against seven gates plus the voiding sub-tests. [How the method works](#) · [Browse all concepts](#)
